

GDX and Matrix Screening

It is our intention and goal to provide you with the most comprehensive eye examination possible using the most current technology available for managing the health of your eyes. For that purpose, we have brought in two pieces of equipment that are used for the diagnosis of potential vision problems.

One of these is the GDX which scans the nerve layer of the retina and potentially determines the beginning of glaucoma within the eye up to four years earlier than previously possible. The second machine now available is the Matrix Visual Field Analyzer which is used in conjunction with the GDX.

We recommend you have these screening tests performed at the time of your routine eye examination. The results of these tests will determine if more extensive testing may be necessary.

There is an additional fee of \$35.00 for the combined GDX and Matrix screening tests. This fee is not covered through routine vision insurance plans. However, if further testing is indicated by the GDX and Matrix screening results, that further testing would be covered through your medical insurance.

Yes, I would like to have the screening performed.

No, I do not want to have the screening performed.
